

Distribution Stability Versus Growth By AI Allocation

Note: A "cut" is an annual distribution more than 25% below its prior peak. Assumes a \$5B corpus, 25-year horizon, a 2.5% spend rate with 0.70 smoothing, and 10,000 simulations. Reserve is held at 25%; the Real-Economy bucket absorbs the remainder (*100% AI is the all-AI case, with 0% Reserve).
